

Smith Branch Monitoring Sites

Monitoring Data Summary for April 25th, 2019 – June 18th, 2019

Data Gaps

- The SMIA turbidity sensor became fouled for a brief period between May 16th-20th that was removed from the dataset.
- There are several gaps in the SMIB data. The reasons for these gaps are explained below:
 - The SMIB specific conductivity and temperature sensors became unsubmerged from May 14th to June 6th. During this period, the specific conductivity and temperature data was deleted, as well as the pH and DO data which are temperature-dependent parameters.
 - Several periods of turbidity data were deleted due to sensor fouling.
 - Several periods of specific conductivity were deleted because the sensor became unsubmerged from the water.
- The website experienced reporting issues with the CS451 pressure transducers at ROCA and ROCB from May 18th-19th, therefore no CS451 stage data was recorded during that brief period.

SCDHEC Standards

- Neither of the Smith Branch stations recorded pH values outside of the acceptable SCDHEC range of 6 to 8.5.
- The SMIA and SMIB stations recorded average DO concentrations of 7.3 mg/L and 7.8 mg/L, respectively, which are both well above the SCDHEC daily average standard of 5 mg/L.
- The minimum DO concentrations recorded at both SMIA and SMIB were 4.5 mg/L and 6.0 mg/L, respectively, which are well above the SCDHEC discrete minimum standard of 4 mg/L.

Storm Events

- The SMIA station recorded 5 storms (at least 0.1 inches) in this monitoring period resulting in 3.3 inches of precipitation. The SMIB station also recorded 5 storms (at least 0.1 inches) resulting in 3.8 inches of precipitation.
- The Smith Branch monitoring stations both recorded typical water quality responses to the storm events observed during this monitoring period.
- The maximum antecedent dry time since the last significant precipitation event (at least 0.1 inch) was approximately 24.5 days in the Smith Branch watershed, occurring prior to the June 5th storm event.

Potential Illicit Discharges and Abnormal Events

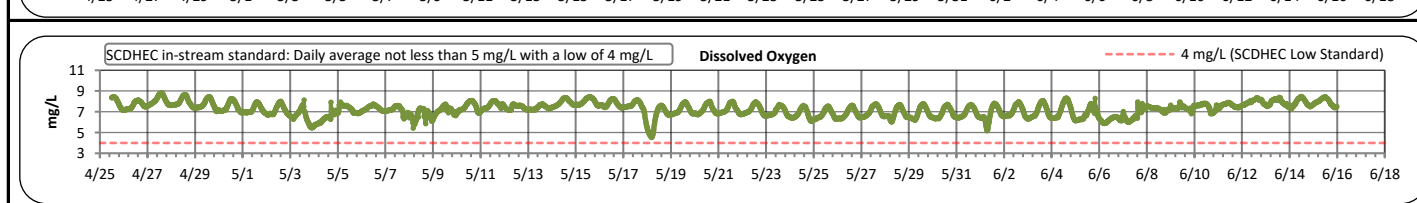

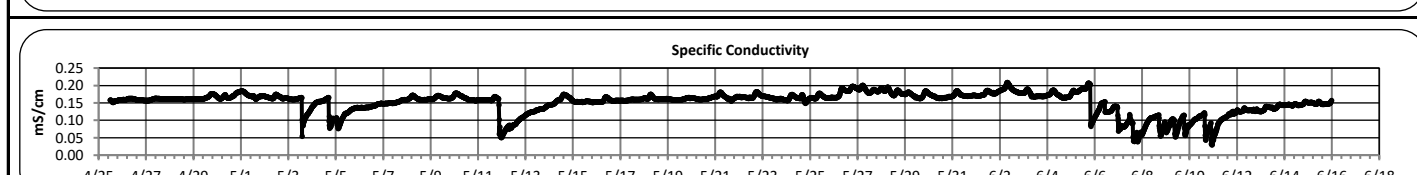

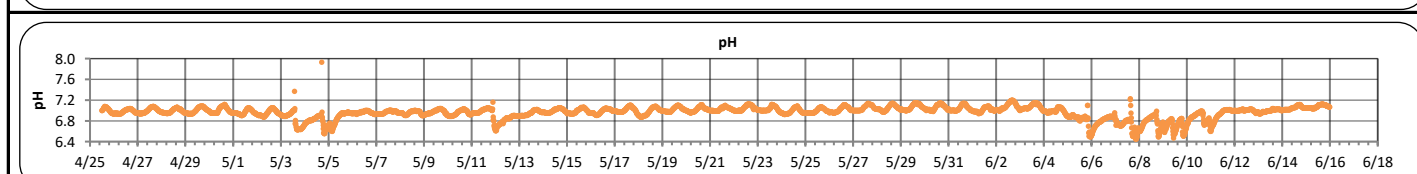

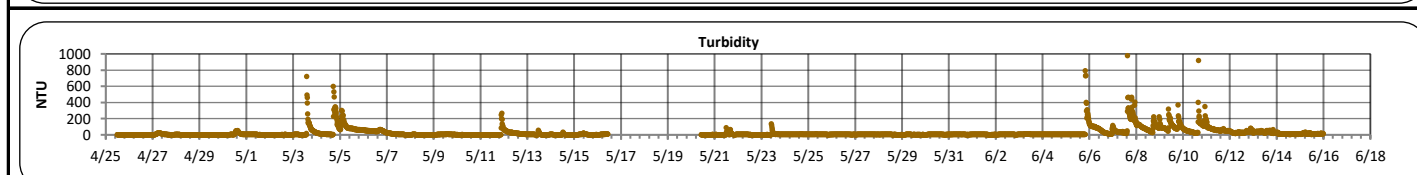

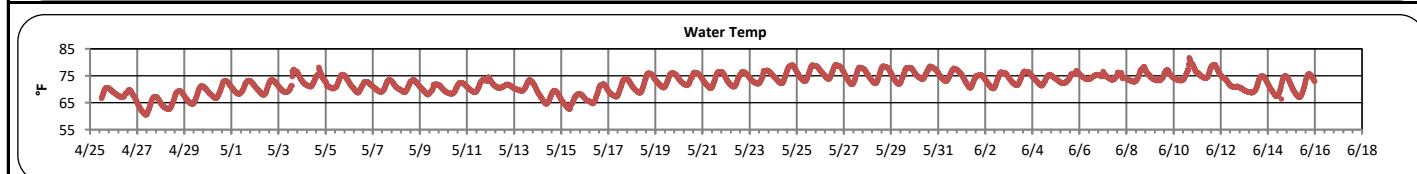

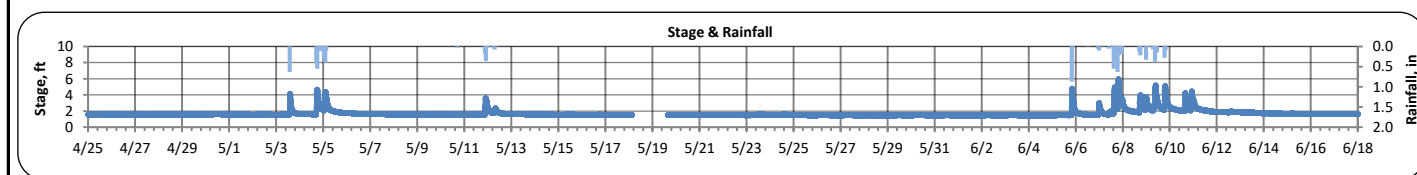

- The SMIA turbidity data increased on May 13th-15th and May 21st-23rd that do not appear to be driven by storm events. No other water quality parameters were impacted during these times, so it is possible that these increases may have been caused by construction in the area upstream of the SMIA station.
- There were no potential illicit discharges in the Smith Branch watershed during this monitoring period.

Flow Measurements

- No flow measurements were taken in this watershed during this monitoring period.

Smith Branch A (April 25, 2019 -- June 18, 2019)

Explanation of Statistics:

MINIMUM OBSERVED	The minimum of the values recorded by the datasonde in 15 minute intervals.
MAXIMUM OBSERVED	The maximum of the values recorded by the datasonde in 15 minute intervals.
MEDIAN OBSERVED	The median of all the values recorded by the datasonde in 15 minute intervals.
MEAN OBSERVED	The average of all the values recorded by the datasonde in 15 minute intervals.
STANDARD DEVIATION	The standard deviation of all the values recorded by the datasonde in 15 minute intervals.
